

Workaround for allowing displaying videos on the Moodle app hosted in video hosting platforms with domain restrictions

This workaround should work for wistia, bunny.net and probably similar platforms.

1. Save the embed code provided by your platform into a new file with .html extension (for this tutorial we are using a file called wistia.html). Each video will need its own .html file. If the platform asks you about using a Javascript code or just HTML with iframe, please select the HTML option.

	2 . Create a new Page activity by selecting the “Make available but don’t show on course page” option under the “common module settings section”. This page will be used to host all the .html videos created in step 1 3. As displayed in the screenshots, in the Content section create a new link for each video by writing a name for the video, selecting the name and clicking the “link” option in the editor. 4. Upload the .html file you created for the video in the first step and select it once uploaded. 5. Once the link has been created, click on “Save and display” in the page configuration screen
	6. Copy the link to the video you want to use on the page you created by doing a right click over the name of the video “Copy link”

 Adding a new URL to Topic 1 General Name: My wistia video External URL: /pluginfile.php/16487/mod_page/content/1/wistia.html Description: [Rich text editor with 0 words] ☐ Display description on course page Appearance Display: Embed ☐ Display URL description	7. You can use that link in different ways, for example, to just link to the video on the main course page you can: 7.1 Create a new URL activity 7.2 Include the link you created in the previous step in the “External URL” field 7.3 Under Appearance select “Display = Embed”
8. If you want to embed the video in a book, label, page or another activity you can use the following code (remember to enable the source code view in your editor) <pre><div class="embed-responsive embed-responsive-16by9"> <iframe class="embed-responsive-item" src="LINK_TO_VIDEO_FROM_STEP_6"></iframe> </div></pre> If your video is not in 16:9, you can replace 16by9 in the class by 4by3 for example (for 4:3)	

Technical explanation

What this workaround does is forcing the mobile app to serve the video using an iframe pointing to a file hosted in the Moodle site. This will ensure that the video referrer is the Moodle site URL hence a valid domain for the platform hosting the videos.

Troubleshooting:

iOS only: Users do not see the video and are asked to log in to the website: If you are using an iOS device please ensure to enable the setting "Allow Cross-Website Tracking" available via the iOS Settings app (look for the Moodle app, at the bottom) on your iPhone/iPad with iOS 14 or above.
